Backend, GenAI & System Design. Software Development Engineer III at Meesho with 8+ years building production backend platforms across Generative AI (GenAI), LLM workflows, distributed systems, microservices, data ingestion, and analytics. Owns Agentless support automation and shared GenAI platform services end to end, from idea and API design through rollout, stakeholder alignment, and maintenance.

TECHNICAL SKILLS

System Design	Java, Spring Boot, Python, FastAPI, REST APIs, microservices, API design, circuit breakers, distributed systems
Generative AI	Azure OpenAI, LLM routing, prompt registries, model/deployment registries, evaluation loops, intent classification, response generation, agent loops
Data / Reliability	Kafka, MongoDB, Redis, Elasticsearch, Apache Spark, Prometheus, Grafana, Metabase, Terraform, Jenkins

CORE SYSTEMS

- Agentless Support Automation: SOP-driven ticket/category workflows, entity-level orchestration, human escalation, retries, DLQs, replay, and stalled-ticket recovery.
- GenAI Platform: intent classification, response generation, LLM routing configuration, prompt/model/deployment registries, evaluation flows, observability, and Azure OpenAI operations.
- Data / Reliability Systems: data-orchestrator execution layer, scalable API composition, contact-center ingestion, survey/call metadata pipelines, migration tooling, reconciliation dashboards, and BI pipelines.

SELECTED IMPACT

- Own production Agentless support automation and shared GenAI platform services end to end, covering architecture, implementation, rollout, maintenance, design reviews, stakeholder demos, and product/support/business coordination.
- Expanded automated supplier-support coverage to 60% of supplier ticket categories by converting business-owned SOPs into configurable workflow steps, rules-engine logic, GenAI intent classification, and supplier response generation.
- Designed a config-driven data-orchestrator architecture for internal API composition; led execution-layer implementation for concurrency and fan-out, enabling configuration-only onboarding for new support categories.
- Reduced Support Chatbot human escalation from 25% to about 10% by evolving one-step LLM responses into an agent loop and improving retrieval, routing, prompts, evaluation, fallback policy, UI flows, and API context.
- Improved support-system efficiency by cutting contact-center ingestion runtime from 2 hours to 2 minutes, load testing 5x projected sale traffic, and reducing pod requirements from 35 cores / 70 GB to 21 cores / 40 GB.

EXPERIENCE

Meesho | Software Development Engineer III, promoted from SDE II

May 2022 - Present
Bengaluru, India

- Lead end-to-end design, implementation, and maintenance of Agentless, an automated supplier-support resolution platform, combining Java/Spring orchestration with Python/FastAPI GenAI services.
- Translated business-owned SOPs into configurable workflow steps, MVEL rules, and GenAI-backed intent classification / response generation, expanding automation coverage to 60% of supplier ticket categories.
- Built and maintain shared GenAI platform services for model/deployment registries, prompt templates, LLM routing configuration, deterministic traffic splits, evaluation flows, Prometheus/Grafana observability, and Terraform-backed Azure OpenAI operations.
- Reduced Support Chatbot escalation to human agents from 25% to about 10%, with lows around 8%, by improving FAQ retrieval, model routing, prompt behavior, evaluation loops, fallback policy, UI flows, and order/API context.
- Delivered high-availability customer/supplier support systems with Java, Spring Boot, Kafka, MongoDB, replay-safe orchestration, external ticketing-platform sync, reconciliation dashboards, and zero-downtime migration patterns.
- Built data and analytics pipelines for contact-center call metadata and survey responses, replacing manual reporting workflows and reducing one ingestion runtime from 2 hours to 2 minutes.
- Built an SOP-driven support orchestrator with Kafka fan-out/fan-in, MongoDB ticket/entity processing contexts, multi-phase workflows, step-level idempotency, retries, DLQs, stalled-ticket recovery, and human escalation paths.
- Designed a config-driven data orchestrator to model internal APIs through field/API dependencies; led execution-layer delivery for API composition, concurrency, and fan-out to make new support-flow onboarding configuration-driven.
- Mentored junior engineers through implementation of the data-orchestrator execution layer and onboarding automation; owned task decomposition, design reviews, code reviews, stakeholder demos, and cross-functional delivery.
- Evolved chatbot answer generation from one-step LLM responses to an agent loop that could gather ticket/order context and produce more reliable supplier/customer responses.
- Improved production readiness by load testing 5x projected sale traffic and helping resolve a thread-pool memory leak that reduced pod requirements from 35 cores / 70 GB to 21 cores / 40 GB.

Oracle | Software Developer

Jun 2021 - May 2022
Hyderabad, India

- Built an embeddable Oracle Commerce integration plugin for credential collection, field mapping, sync initiation, and sync monitoring using Oracle Visual Builder, JavaScript, and Knockout.

Jio | Software Developer

Jul 2018 - May 2021
Navi Mumbai, India

- Built Java/Python services over Elasticsearch, Kafka, and Spark for computation, forecasting, monitoring, cluster operations, and BI pipelines; developed HA deployment and monitoring services.

EDUCATION

Indian Institute of Technology, Ropar | B.Tech., Electrical and Electronics Engineering 2014 - 2018
